Name : Anushka Gupta

Regestration Number : 25BCE11377

Branch : Computer Science and Engineering

Year : 2025-2029

Course Code :

Date : 30/03/2026

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to **VIT Bhopal University** for providingthe **VITyarthi E-Learning Platform**, which served as the foundation for this course.I am grateful to the faculty of the **CSE0001 - Digital Literacy** course for designing acurriculum that emphasizes practical, real-world digital skills.

Special thanks to my instructors for their guidance throughout the five modules,from professional communication to cybersecurity awareness. I also appreciate thecreators of the open-access tools used in this project—including **GitHub, Canva,and Google Workspace**—which allowed for a seamless, browser-based learningexperience. Finally, I thank my peers for their collaborative spirit in exploring thesedigital platforms together.

Introduction: Project Overview and Scenario

As a newly selected **Student Digital Ambassador** at VIT Bhopal, my mission is to guide my peers through the complexities of our modern digital world. This project isn't just an assignment; it’s a foundational **Digital Literacy Portfolio** designed to show how we can communicate safely, build professional identities, and stay responsible online.

The journey is broken down into five key milestones. I started by creating a visual guide to digital literacy, then moved on to building a professional presence on platforms like **LinkedIn** and **GitHub**. I also explored technical tools for coding and collaboration, refined my professional emailing skills, and dived deep into the world of cybercrime prevention. By organizing all this work into a single GitHub repository, I’ve created a roadmap that I hope will help my batchmates navigate their own digital careers with confidence.

Task 1

In this task canva tool was used for creating visual single infographic or visual slide that covers 3 topics that were: what digital literacy is, useful digital tools for students, safe internet practices.

Design shows the 3 topics in different sticky notes so the viewer don't get confuse while understanding it and the top rectangular note is for explaining the motive of presentation.

Portraying your mind visuals into desktop was the most interesting part while making it and there was no such difficulty while making it but the crucial stage was when it has to be decided which elements should be used for representing visuals clearly and this stage glorify our decision making skills.

This presentation will help the veiwer to understand about the digital literacy, its tool and safety measure everyone should practice for preventing them from hackers. Any prior knowledge about complex topics are not required to understand it so the viewer does not have to

face any complexity while comprehending that makes this presentantion acknowledgable to everyone with no or basic information.

Task 2

In this task Linked in, Kaggle and github profile was updated.

LinkedIn and GitHub are two platforms that can quietly shape a student's journey even before their career begins. LinkedIn is mainly used for building a professional identity—it's like your digital resume where you showcase your education, skills, achievements, and connect with professionals, seniors, and recruiters. Whereas GitHub is a space to share your coding projects, collaborate with others, and actually prove your technical skills through real work.

These platforms can become extremely valuable over the next four years. In the beginning, you can start by creating a simple LinkedIn profile and connecting with classmates, seniors, and mentors while sharing small achievements like certifications or workshops. Simultaneously, you can use GitHub to upload basic coding projects as you learn programming. It helps to build stronger projects, contribute to open-source, and showcase internships. Each profile will reflect your complete journey, making it easier to grab internship and job opportunities with confidence.

TASK 3

In this task, I utilized **HackerRank** for coding and **Google Forms** for collaboration.Completing the "Solve Me First" challenge was an insightful introduction tocompetitive programming; it taught me how to interpret problem constraints andhandle standard input/output, which is a vital skill for upcoming technical labs.Building the Digital Literacy Quiz highlighted the efficiency of the GoogleWorkspace ecosystem. By linking the form to a spreadsheet, I learned how toautomate data organization, a practice that will be incredibly helpful for groupprojects and future research surveys.

These platforms are more than just websites; they are essential academic tools.**HackerRank** provides a structured path for me to improve my logic and syntax inlanguages like Python or C++, while **Google Forms** simplifies the process ofgathering peer feedback. Mastering these tools early in my B.Tech journey ensuresthat I can collaborate effectively with my batchmates and stay prepared for thedigital demands of the modern engineering curriculum

TASK 4

Situation of Poor Digital Communication

A college student once received an internship email but did not read it carefully. The email clearly mentioned that the interview was scheduled for *10:00 AM online*, but the student misunderstood it as *10:00 PM*. Because of this confusion, the student missed the interview completely and lost the opportunity. This mistake happened due to careless reading.

This problem could have been avoided with better digital communication. The student should have read the email properly, checked the time format (AM/PM), and confirmed the details if there was any doubt. Replying to the email for confirmation or setting a reminder in personal mobile phone could also help. Clear understanding, attention to detail, and timely response are very important in digital communication to avoid such issues.

TASK 5

UPI/online Payment Fraud is very common that is covered in this task for Case Study.

While researching on this topic understanding of digital Payment frauds became more clear than before. The most important or intersting thing found was the “REQUEST” button that convincie you to withdrawal of money but it is a scam or fraud , when you enter the pin demanded, your money will get transfer automatically , Initially i don’t had any idea of that “REQUEST” button but after making this case study and prevention checklist i got it also i don’t know about the number “1930” but after working on this task i got it too.

I will always keep remember to check every minor detail before payement or receiving and after every transaction i will try to check my overall bank balance and never check out for any irrelevant messages or spam calls in hurry.

CONCLUSION

Completing this project has significantly enhanced my digital competence and confidence as a Student Digital Ambassador. I have learned that digital literacy extends far beyond basic computer skills; it encompasses the ability to present oneself professionally on platforms like LinkedIn and GitHub, collaborate effectively using cloud tools, and communicate with proper etiquette. Furthermore, researching cybercrime has highlighted the critical importance of vigilance in the Indian digital ecosystem. Ultimately, this assignment has taught me how to curate a permanent digital footprint that is both secure and professional, providing a strong foundation for my future academic and career endeavors.
